

General Info

1. Can I install Wolf-Guard home alarm system myself?

Absolutely. Part of what sets Wolf-Guard apart from the competition is that you don't need a technician to come to your house. Within 30 minutes you can set up your wireless Wolf-Guard alarm system, and do it on your own schedule. If you want any guidance, simply call our support team and we will walk you through the process.

2. How do I select the right equipment to protect my home or business?

Start with the points of entry: 90% of break-ins occur through the front or back door, so ensure that all accessible doors have sensors. Ground-floor windows may be protected by individual sensors, motion sensors, or glass break sensors, depending on the layout of your home or business.

3. Why the hype over wireless security? Is it really safer?

Yes, wireless/cellular systems really are safer! A wireless system is not dependent on your phone line, internet connection, or any other system in your house. The system won't go down if your landline or internet goes down.

All the communication is built into the system itself. Using this built-in cellular signaling technology, a Wolf-Guard Control Panel alerts the Monitoring Center in case of trouble. This type of technology is safer than traditional wired alarm systems, because there are no wires for burglars to cut. The wireless sensors provide an added bonus.

4. Do I have to install wires everywhere throughout my house?

Not exactly. Most of our system works wirelessly. The accessories work on (included) batteries. Only the control panel needs power and therefore needs the AC adapter with cable.
